Hello! We recently observed an unusual change in the SSH service log file size on one of our systems. No need to worry—it turned out to be the new IT guy's daughter (Fawads), who managed to break into the system with my permission to test some services. I'm sharing the log file and would appreciate your help addressing the following questions.

1. Is it an internal or external attack, what is the attacker IP?
   Format: `internal/external:IP`

2. How many valid accounts did the attacker find, and what are the usernames?
   Format: `NumberOfValidAccounts:user1,user2,...`

3. How many times did the attacker login to these accounts?
   Format: `Number of Successful Logins`

4. When was the first request from the attacker recorded?
   Format: `yyyymmdd hh:mm:ss.ms`

5. What is the log level for the log file?
   Format: `Log Level`

6. Where is the log file located in Windows?
   Format: `C:\path\to\file.extension`
